### Notes:

1. This separation requirement is to provide accessibility for construction and maintenance. Three feet of horizontal separation is the minimum for pipes with three feet of cover. For pipes installed at greater depth, provide an additional foot of separation for each additional foot of depth.

2. The minimum joint spacing required from crossing from other utilities while still maintaining minimum vertical separation.

3. Distances given are from outside of pipe to outside of pipe.

4. No water pipe shall pass through or come into contact with any part of sanitary or storm water manhole or structures.

5. Water main should cross above other pipes whenever possible. When water main must be below other utility piping, the minimum separation shall be 12 inches.

6. Refer to Section 429, III.4.3.

7. Refer to Section 429, III.4.2 for minimum separation requirements from pipe to structures.

**Separation Requirements for Water, Wastewater and Reclaimed Water Mains**

January 2020  Plate S-26
WATER MAIN AND NON-WATER MAIN SEPARATION REQUIREMENTS - NOTES

1. It is required that “water mains” be installed, cleaned, disinfected and have a satisfactory bacteriological survey performed in accordance with the latest applicable AWWA standards, Chapter 62-555, F.A.C. and latest JEA water and sewer standards. For the purpose of this section, the phrase “water mains” shall mean mains, including treatment plant process piping, conveying either raw, partially treated, or finished drinking water, fire hydrant leads; and service lines that have an inside diameter of three (3) inches or greater. In addition, the phrase “reclaimed water” refers to the water regulated under Part III of Chapter 62-610, F.A.C.

2. New or relocated, underground water mains shall be laid to provide a horizontal distance of at least three (3) feet between the outside of the water main and the outside of any existing or proposed storm sewer, stormwater force main, or pipeline conveying reclaimed water.

3. New or relocated, underground water mains shall be laid to provide a horizontal distance of at least six (6) feet, and preferably ten (10) feet, between the outside of the water main and the outside of any existing or proposed gravity or pressure-type sanitary sewer, wastewater force main, or pipeline conveying reclaimed water. The minimum horizontal separation distance between water mains and gravity-type sanitary sewers may be reduced to three (3) feet where the bottom of the water main is laid at least six (6) inches above the top of the sewer (special case).

4. New or relocated, underground water mains crossing any existing or proposed gravity or vacuum-type sanitary sewer or storm sewer shall be laid so the outside of the water main is at least six (6) inches, and preferably twelve (12) inches, above or at least twelve (12) inches below the outside of the other pipeline. However, it is preferable to lay the water main above the other pipeline.

5. New or relocated, underground water mains crossing any existing or proposed pressure-type sanitary sewer, wastewater or stormwater force main, or pipeline conveying reclaimed water shall be laid so the outside of the water main is at least twelve (12) inches above or below the outside of the other pipeline. However, it is preferable to lay the water main above the other pipeline.

6. At the utility crossings described in notes 4 and 5 above, one full length of water main pipe shall be centered above or below the other pipeline so the water main joints will be as far as possible from the other pipeline. Alternatively, at such crossings, the pipes shall be arranged so that all water main joints are at least three (3) feet from all joints in vacuum-type sanitary sewers, storm sewers, stormwater force mains, or pipelines conveying reclaimed water, and at least six (6) feet from all joints in gravity or pressure-type sanitary sewers, wastewater force mains, or pipeline conveying reclaimed water.

7. New or relocated fire hydrants shall be located so that the hydrants are at least three (3) feet from any existing or proposed storm sewer, stormwater force main, or pipeline conveying reclaimed water; at least three (3) feet, and preferably ten (10) feet, from any existing or proposed vacuum-type sanitary sewer, at least six (6) feet, and preferably ten (10) feet, from any existing or proposed gravity or pressure-type sanitary sewer or wastewater force main.

8. Where an underground water main is being laid less than the required minimum horizontal distance from another pipeline and where an underground water main is crossing another pipeline and joints in the water main are being located less than the required minimum distance from joints in the other pipeline, the contractor shall consult the design engineer to obtain approval of any alternative construction methods, prior to construction.

1. THIS SCHEDULE SHALL BE UTILIZED ON ALL WATER, SEWER FORCE MAIN OR RECLAIMED WATER SYSTEMS. ALL FITTINGS SHALL BE RESTRAINED TO LENGTHS INDICATED ON THE ABOVE SCHEDULE, AT A MINIMUM.

2. ASSUMPTIONS: PVC PIPE, SAFETY FACTOR=1.5, TEST PRESSURE=150PSI, SOIL=GM OR SM, TRENCH TYPE 3, DEPTH OF COVER=30 INCHES FOR 20" AND SMALLER PIPE SIZE OR 36 INCHES FOR 24" AND LARGER PIPE SIZE.

3. BENDS AND VALVES: SHALL BE RESTRAINED ON EACH SIDE OF FITTING.

4. VERTICAL OFFSETS: ARE APPROX. 3 FEET COVER ON TOP AND APPROX. 8 FEET COVER ON BOTTOM. PER THE DETAILS, L_U IS THE RESTRAINED LENGTH FOR THE UPPER (TOP) LEVEL. L_L IS THE RESTRAINED LENGTH FOR THE LOWER (DEEPER) LEVEL. ASSUME 45 DEGREE BENDS.

5. TEES: TOTAL LENGTH BETWEEN FIRST JOINTS OR RESTRAINED LENGTH ON EITHER SIDE OF TEE (RUN) SHALL BE A TOTAL DISTANCE OF 30 FEET (MIN). SEE SCHEDULE ABOVE FOR RESTRAINT LENGTH ON TEE "BRANCH" LINE.

6. HDPE TO PVC TRANSITIONS: THE PVC PIPE SIDE SHALL BE RESTRAINED 35 FT (MIN).

7. THE INSTALLATION OF BELL HARNESS RESTRAINTS AT PVC JOINTS (DR-18 & 25 PIPE) SHALL BE COMPLETED PER THE MANUFACTURERS RECOMMENDATION, WHICH INCLUDES NOT OVER TIGHTENING THE PARALLEL RODS/NUTS. THESE NUTS SHOULD ONLY BE SNUG TIGHT. THE HOME MARKS ON THE PIPE SHOULD ALWAYS BE VISIBLE AFTER THE RESTRAINT IS INSTALLED. OVERHOMING THE JOINT MAY CAUSE A FAILURE AT THE BELL RESULTING IN A SERVICE OUTAGE.

### Notes:

1. All bearing surfaces to be carried to undisturbed soil.
2. These tables show minimum sizes for thrust blocks in good soil (A-1 thru A-3, clean sands and gravels) with minimum bearing capacity of 2000 psi.
3. Poor soils A-4 thru A-8, silty soils, clays, muck and peat will require larger thrust blocking.
4. Both concrete thrust blocks and tie rods must be used when, in the judgment of the engineer, the nature and criticality of an installation is such as to require positive assurance of stability.
5. The use of thrust blocks shall be limited to situations such as point repair where exposing several joints of pipe is not feasible due to existing ground conditions.
6. Concrete collars with tie rods may be used on dead end lines at the contractor's discretion.
7. Maximum test pressure to be 150 psi.
NOTES:

1. SEWER PUMP-OUT BOX SHALL BE CONSTRUCTED ON PRIVATE PROPERTY AND LOCATED AT THE R/W LINE. THE PREFERRED CONSTRUCTION LAYOUT IS SHOWN ABOVE.

2. ASSEMBLY TO BE ENCLOSED WITHIN A 48"x48" (MIN) PRECAST CONCRETE BOX WITH OPEN BOTTOM WITH H-20 TRAFFIC LOADING COVER OR TYPE "C" MANHOLE OPEN BOTTOM WITH FRAME AND COVER (NON-JEA LOGO TYPE COVER).

4. NO CONNECTIONS PERMITTED INTO JEA FORCE MAINS WHICH ARE GREATER THAN 12" WITHOUT PRIOR JEA APPROVAL.

5. QUICK DISCONNECT WITH CAP SHALL BE ALUMINUM AND BE POSITIONED DIRECTLY UNDER MANHOLE LID FOR ACCESS.
